

Outcomes Measurement for Quality and Safety:

Pilot Demonstration Project Professional Practice & Integration (PPI)

Barb Mildon, CNE and VP PPI

Pamela Thorsteinsson, Clinical Practice Consultant and Project Lead

Bonny Amor, Project Coordinator

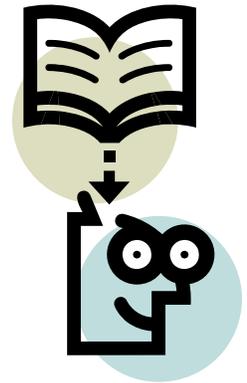

*Sponsored by a grant from the
BC Health Innovation Fund*

Objectives

- “HIF” Outcomes Measurement Project Overview
- Fraser Health participants – demographics
- Project Design
- Results: Patients/Clients and Nurses
- Key Findings
- Recommendations

Acknowledgement and Special Thanks to:

Fraser Health

- Professional Practice & Integration
- Information Technology
- Home Health & Acute Care:
 - **Directors/Managers/Team Leaders:**
 - **HH:** Gail Harris, Jane Davis, Carl Meadows, Pavindeep Heer, Dawn Serek
 - **AC:** Arden Krystal, Theresa Guscotte, Wilma Mendieta
 - Nursing “super-users” and point of care nurses

University of Toronto:

- Dr. Diane Doran
- Jenny Carryer
- Joan Almost

Ontario Ministry of Health:

- Peggy White
- Shannon Landry

Hinext (TREAT):

- Andrew Smith
- Teresa Janz

Fraser Health, BC

Opportunity for Practice Improvement

- **Lack of information available re: nursing contributions to health care outcomes**
 - Paper-based documentation systems
 - MDS in Home Health (Case Managers), starting in Residential Care
- **Nursing-sensitive outcome data needed for**
 - Clinical decision making at point of care
 - Program planning
 - Staffing allocation
- ***“If we cannot name it, we cannot control it, finance it, or put it into public policy.”***
(Clark & Lang, 1992, cited in ICN, 2005, p. 3)

Building on Nursing Research

- NHOP study (Doran et al)
- PDA & CDST studies (Doran et al)
- HOBIC implementation across Ontario, pilots in Sask, & PEI (White et al)

*Defining **nursing sensitive outcomes** as those that are “relevant, based on nurses’ domain and scope of practice for which there is empirical evidence linking nursing inputs and interventions to the outcome”*

(Doran, 2003)

Project Objectives

To Explore the:

1. Ability of nurses to collect outcome data
2. Feasibility of collecting nursing sensitive outcomes data from clients
3. Utility of the outcomes data to indicate the level of safety and quality of clinical care
4. Utility of the outcomes data in demonstrating the contributions of nursing care to the clinical outcomes of clients
5. Influence of the data on nurses' decision-making related to nursing interventions for clients
6. Feasibility of implementing incentive funding for improved outcomes

Project Design

- **Phase I: establish human and technological infrastructure to collect data** (June '07 – Oct '07)
 - Establish participating sites: Acute Care, Home Health (2 of each)
 - Approved Software/Hardware: HOBIC/TREAT, mobile technology (laptop, PDAs, Tablets)
 - Tools for Remote Data Entry: VPN, Aircards
 - Ethics Approval
 - Nursing Education

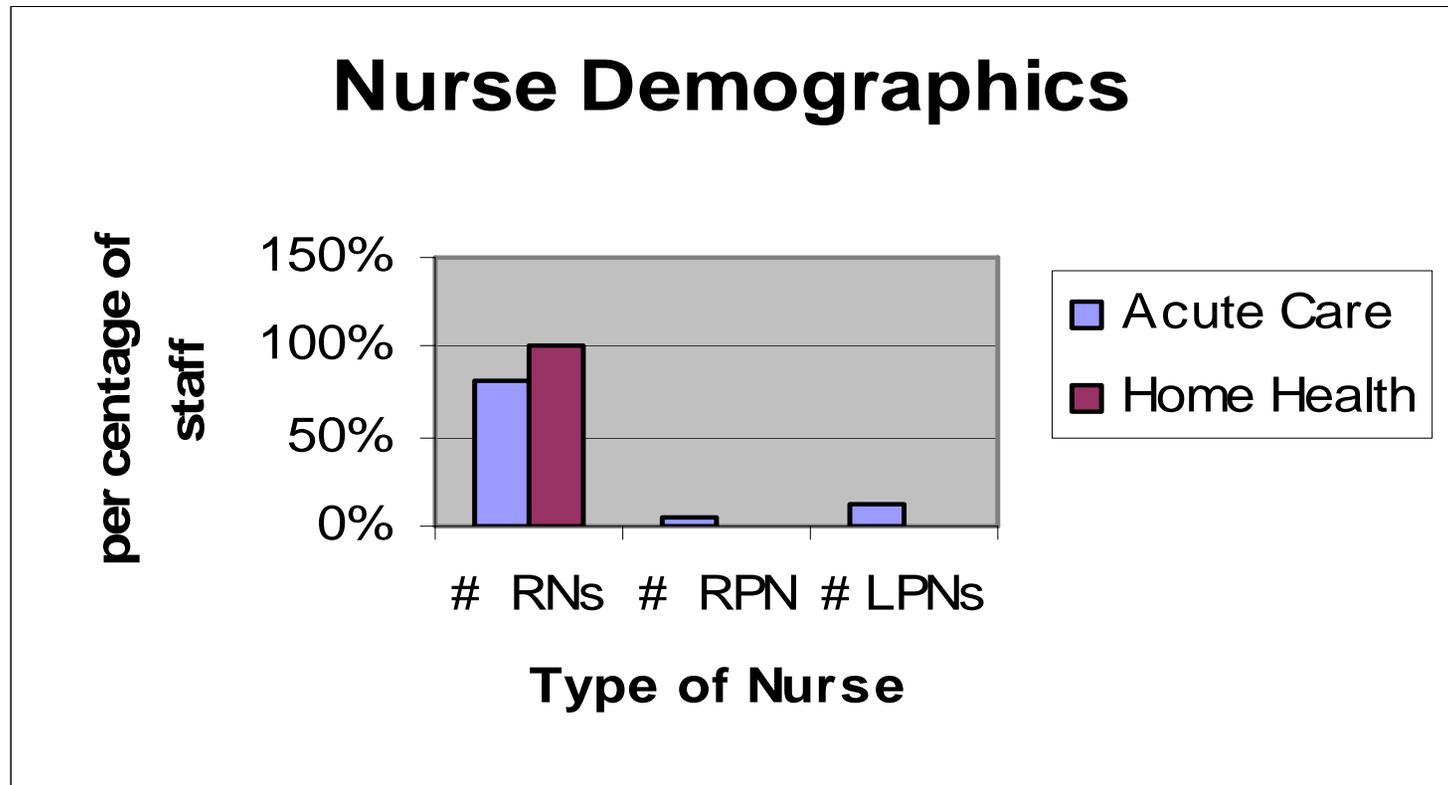

- **Phase II: data collection and review, overall project review** (Nov '07 – Mar '08)
 - Nurse and Patient Consents
 - Patient sample: 30 to 60 per unit
 - Nurse sample:- ~ 25 per unit
 - Ongoing Nursing education and support
 - Patient Assessments, data entry and review
 - Pre and Post Nursing Questionnaires (adopted from NHOP)
 - Baseline and post-data collection
 - Nursing Focus Groups

Fraser Health Participant Demographics

- Nursing Data: 59 nurses collecting data, 42 completing questionnaires, 30 in focus groups

Client Data

Consenting Clients:

Home Health:

HHB = 44

HHNW = 39

Total: **83**

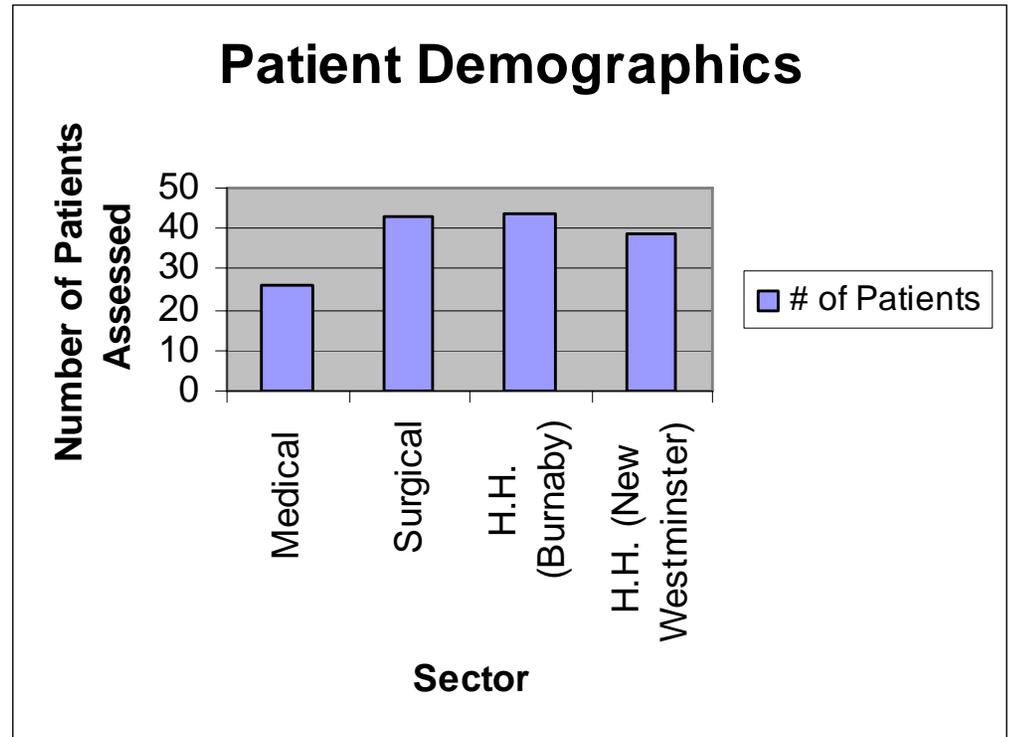

Acute Care:

Medical = 26

Surgical = 43 (invalid 7)

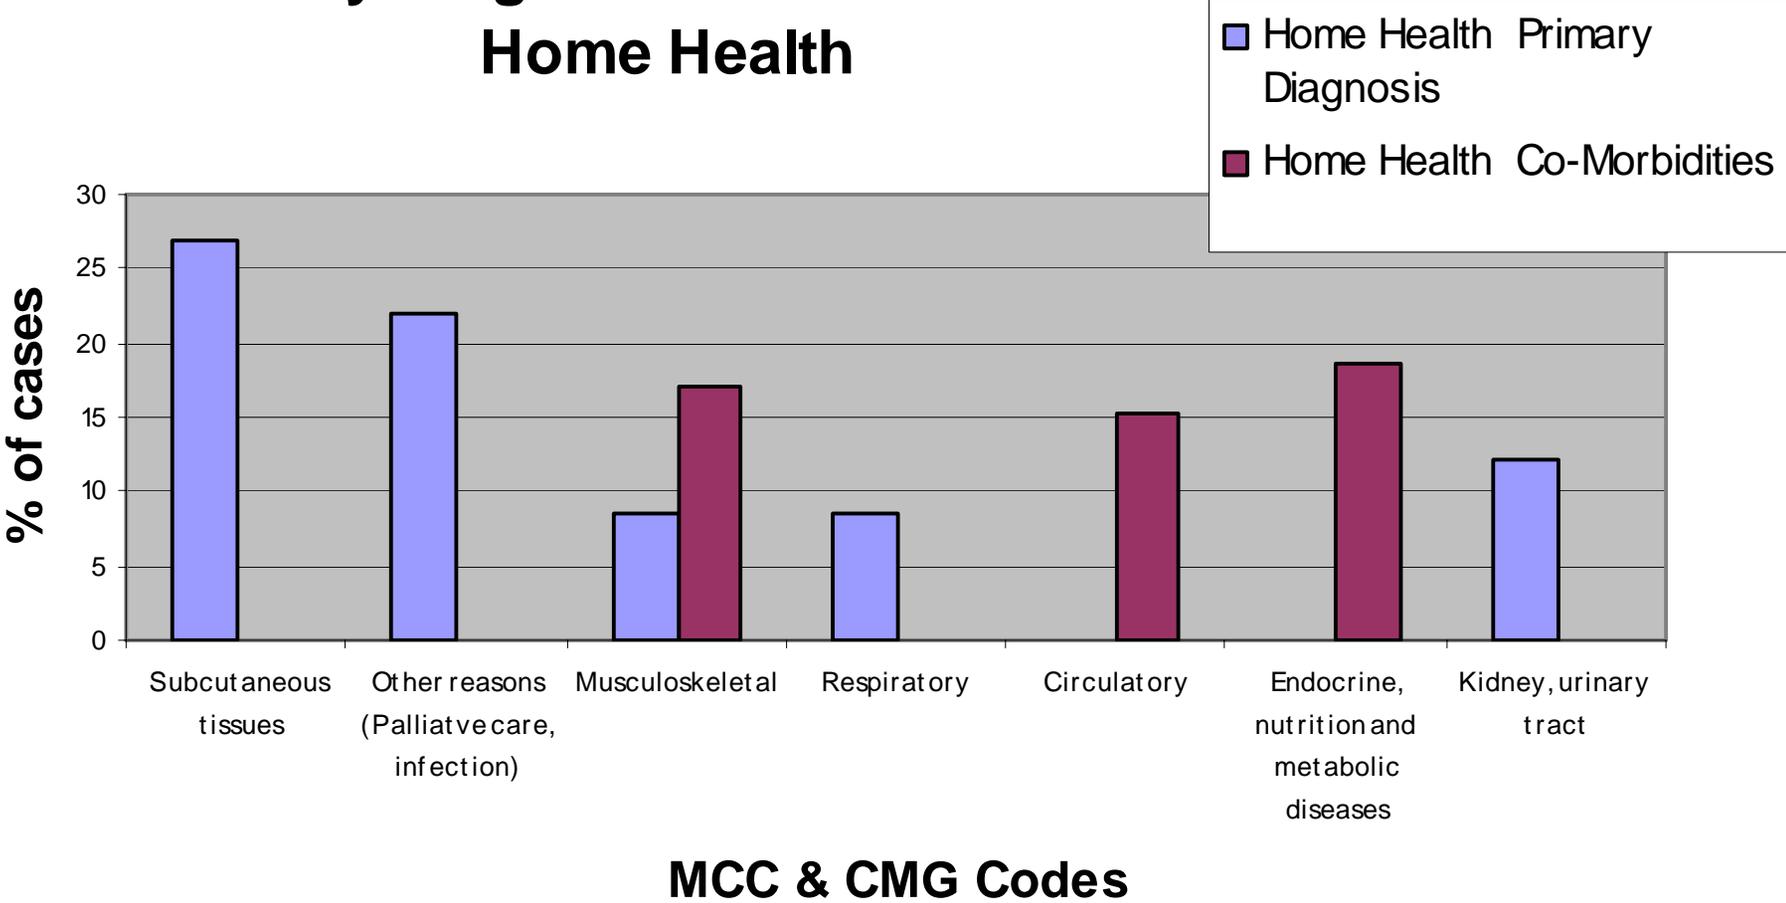

Total: **69**

Total from all areas: 152

Client Health Conditions

Primary Diagnosis & Comorbidities Home Health

Key Findings

1. Nurses able to collect data on paper and via computer

- Informatic infrastructure established, 100% baseline data collected and available

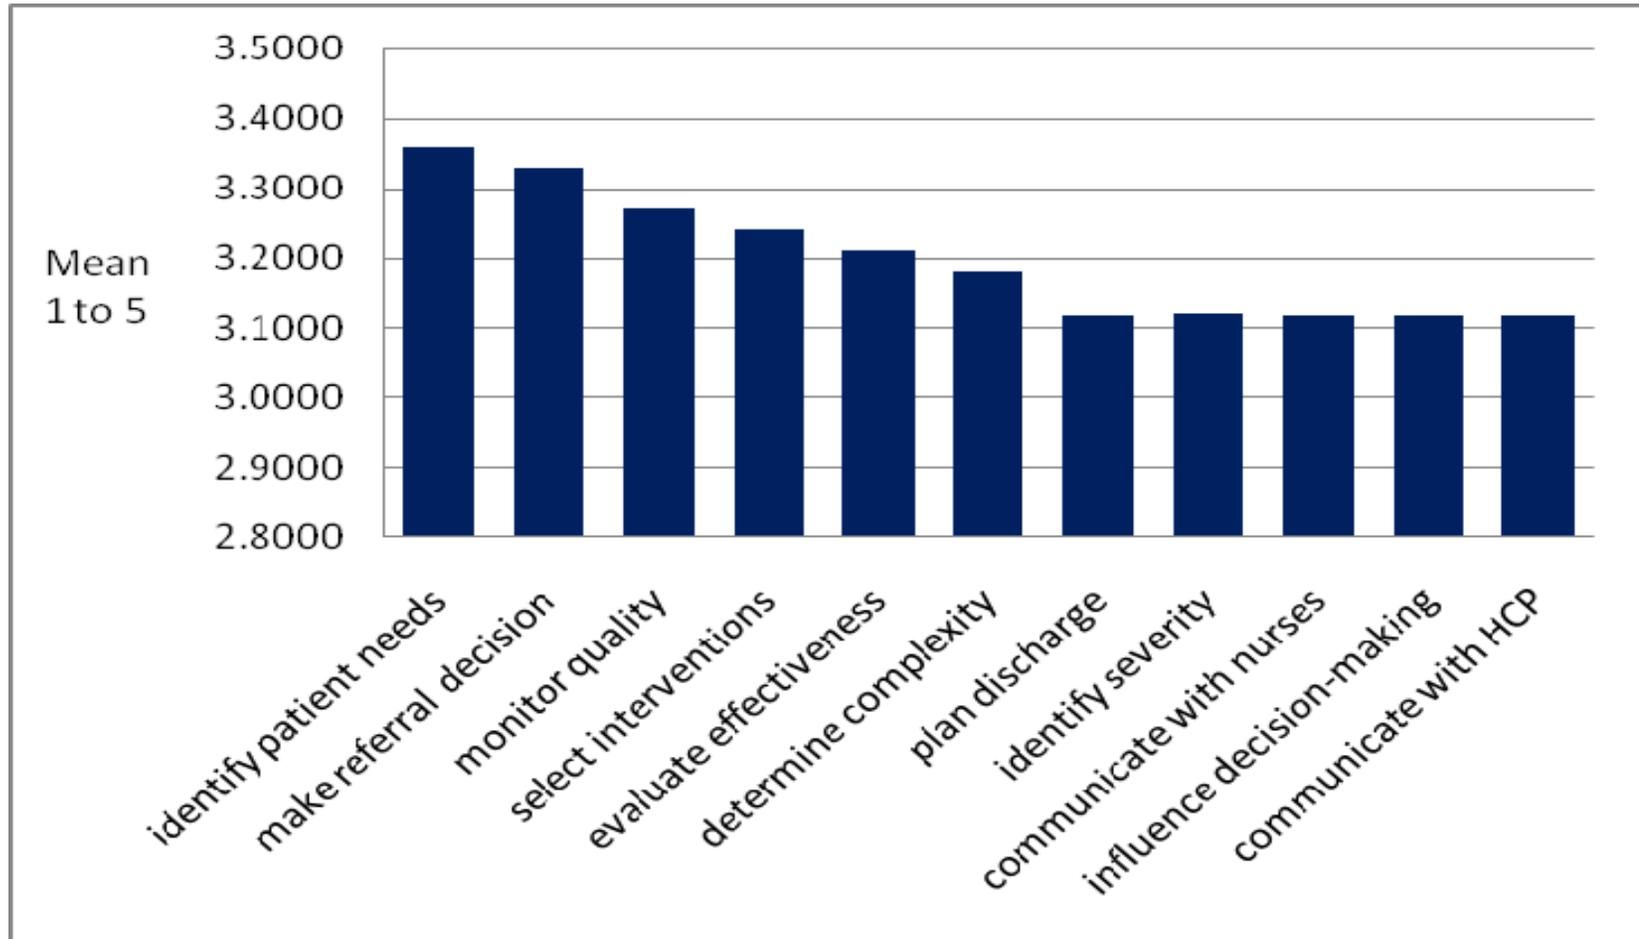

2. Established feasibility of collecting outcome data on ongoing basis

- Assessment tool overall consistent with current practice
- Limitations: nursing knowledge/comfort with electronic data entry, issues with computer access, nursing coverage

Utility

In general, nurses found that the outcome indicators that were documented were most useful for:

3. Utility of outcomes for safety & quality of care

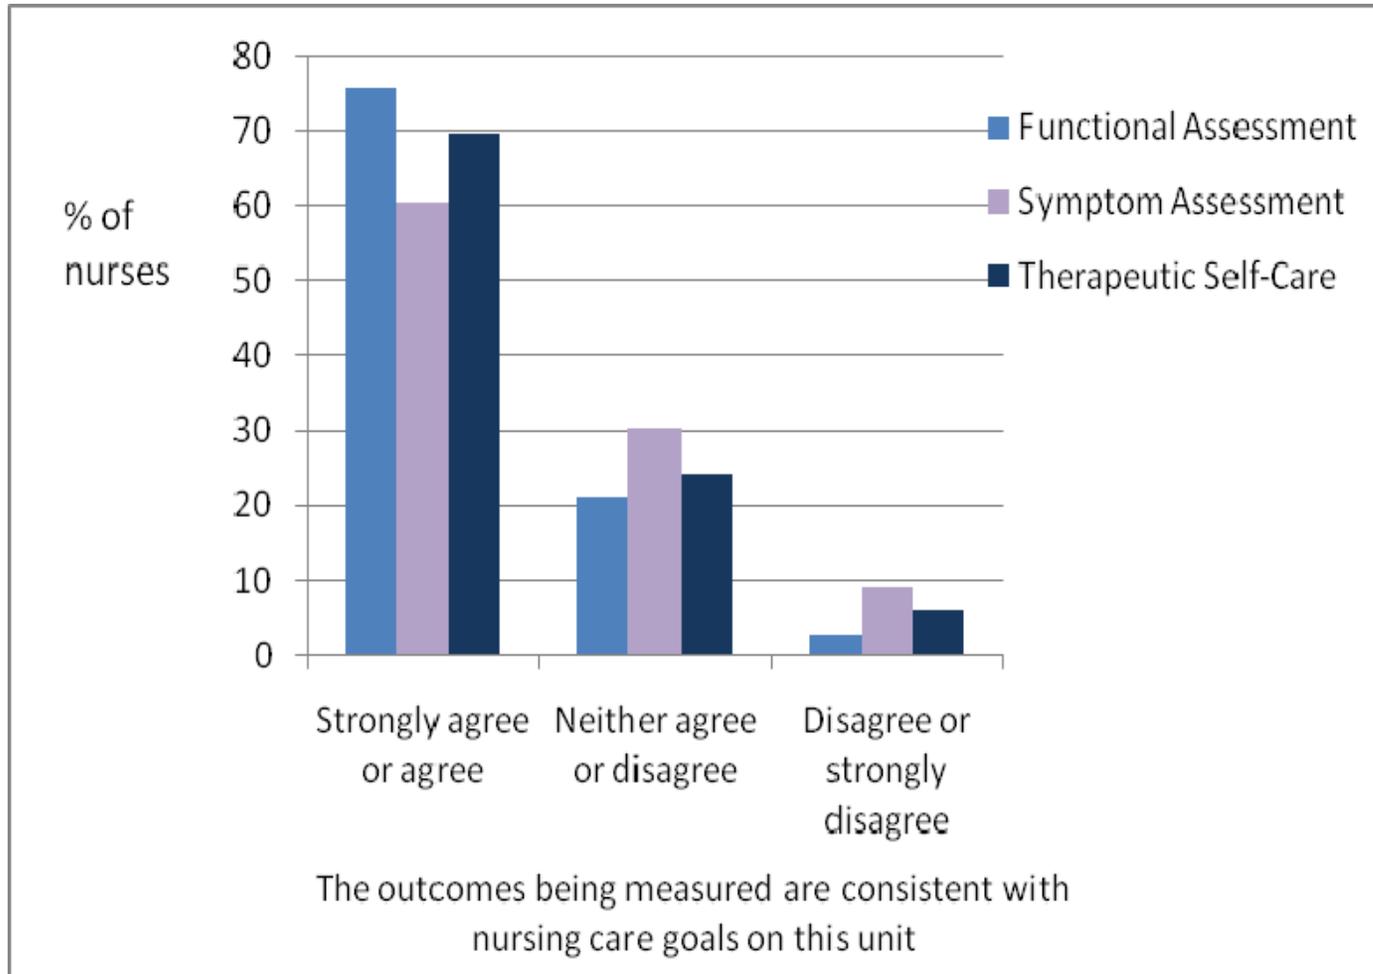

- Functional status, symptoms and therapeutic self care statistically significant in acute care (pain only in HH)
- Pressure ulcer severity, # of falls tracking available
- Reported enhanced assessment scope
- Opportunities for communication across sectors

4. Utility of outcomes to demonstrate contributions of nursing care

- HOBIC measures consistent with goals of care (Acute Care > Home Health)
- Greater perception that outcomes reflected nursing care: improved, maintained client status

Consistency with Nursing Goals

Key Findings – continued:

5. Influence on nursing decision-making

Mixed response: “already doing this” to “improved assessments and therefore interventions”

Limitations: more practice-specific tools needed

4. Feasibility of implementing incentive funding for improved outcomes

- Considerations re: defining “improved outcomes” given patient demographic/diagnostic variances, nursing:client ratios

Recommendations

Technology

1. User-friendly computer access - rapid, easy access, reliable, preferably hand-held (i.e. PDAs)
2. Integration with documentation systems (e.g. ADT, Meditech, charting forms, etc.) and interface
3. **Data results available to nurses at point of care** to inform care delivery

Nursing Education

1. Protected scheduled education time
2. Super-user resource on units

Future Applications:

1. More practice-specific tools, embed Clinical Decision Support Tools into software
2. Access outcome data across sectors
3. Improved applications:
 - 24/7 data entry, required fields/drop-down boxes, prompts/links, nursing observation/comment capability
